

**Ipilimumab-related toxicity: Management of Neurological Reactions**

**Grade 2**

Grade 2 motor neuropathy, muscle weakness, or sensory neuropathy lasting > 4 days

- Omit any scheduled dose of ipilimumab.
- If neurological symptoms resolve to baseline, ipilimumab may be resumed at the next scheduled dose. (Any dose omitted must not be replaced)

**Grade 3/4**

Motor neuropathy, muscle weakness, or sensory neuropathy

- Permanently discontinue ipilimumab.
- Immediately start methylprednisolone IV 2mg/kg/day.
- Refer to neurologist for management of sensory neuropathy.
- In some cases, ITU support may be required for motor neuropathy affecting respiratory muscles.
- Both an atypical Guillain-Barré and myasthenic conditions have been described.
- Once symptoms resolved, the dose of steroid maybe gradually tapered over a period of at least one month-
